

OCEANS BEYOND PIRACY

a project of the One Earth Future Foundation

THE STATE OF
MARITIME PIRACY 2014
ASSESSING THE ECONOMIC AND HUMAN COST

APPENDICES

APPENDICES A-L

APPENDIX A – AREAS OF INTEREST

Various costs and considerations assessed by this report are applicable only in specific geographical areas. For example, ship operators must pay an additional war risk premium to maintain coverage if they enter a designated War Risk Area, while several distinct zones all factor into seafarer hazard pay. Consequently, these regions are essential to our analysis, and for clarity this appendix provides the definition of each relevant zone, region, or area.

Western Indian Ocean Region

Best Management Practices Revision 4 High Risk Area

The Best Management Practices Revision 4 (BMP4) High Risk Area (HRA) “defines itself by where pirate activity and/or attacks have taken place,” and consequently defines the area where it is recommended that ship operators apply best management practices.

The BMP4 HRA comprises the Red Sea, Gulf of Aden, Arabian Sea, Gulf of Oman, and the northern portion of the western Indian Ocean. Its precise limits are Suez to the northwest, the Strait of Hormuz to the north, 10°S, and 78°E.¹

Figure A1: BMP4 HRA

Internationally Recognized Transit Corridor

The Internationally Recognized Transit Corridor (IRTC), established effective February 1, 2009, supports United Nations Security Council resolutions 1814 (2008), 1816 (2008), 1838(2008), and 1846 (2008).²

Though the IRTC is not a formal traffic-separation scheme, much like a freeway, two proximate, parallel lanes conduct traffic along opposite headings: 72° (east-northeast, roughly) for eastbound vessels and 252° (west-southwest) for westerly traffic. The eastbound lane begins at 45°E between 11°48' N and 11°53'N and terminates at 53°E between

14°18'N and 14°23'N. The westbound lane begins at 53°E between 14°25'N and 14°30'N and terminates at 45°E between 11°55'N and 12°00'N.³

IBF Areas

The IBF-designated risk areas identify where transiting seafarers are exposed to the risk of piracy and are thus entitled to additional compensation and other protections as a part of collective bargaining agreements. These areas are designated by the International Bargaining Forum (IBF), which brings together the International Transport Workers' Federation and the international maritime employers that make up the Joint Negotiating Group. Depending on the risk assessed by the IBF, seafarers transiting these areas are entitled to varying levels of additional hazard pay, compensation for injury or death, and the option to elect to not transit the area at no expense to themselves.⁴

International Bargaining Forum List of Warlike and High Risk Designations⁵

These are defined as:

1. IBF WOA

The Warlike Operations Area (WOA) covers Somali territorial waters, which extend 12 nautical miles from the coast. The western boundary runs due north from the Somali–Ethiopian coastal border; the eastern, due north from Cape Guardafui in Puntland.

2. IBF HRA

The High Risk Area comprises the Gulf of Aden, excluding the IRTC, and the waters off the east coast of Somalia, out to 400 nautical miles. The chevron-shaped western boundary runs from the Djiboutian–Somali coastal

border to 11°48'N, 45°E, and from 12°00'N, 45°E to Mayyun Island in the Bab-El-Mandeb Strait. The eastern border runs from Rhiy di-Irisal in Socotra to 14°18'N, 53°E; from 14°30'N, 53°E to the Yemeni–Omani coastal border, and 400 miles off the Somali coast from due east of Socotra to due east of the Kenyan–Somali border.

3. IBF XRZ

The Extended Risk Zone (XRZ) encompasses the HRA and more. The XRZ has the same western boundary as the HRA—from the Djiboutian–Somali coastal border to 11°48'N, 45°E, and from 12°00'N, 45°E to Mayyun Island in the Bab-El-Mandeb Strait—but includes the IRTC. The eastern border is the 78th meridian east (78°E), the northern border is the 26th parallel north (26°N), and the southern border is the 10th parallel south (10°S).

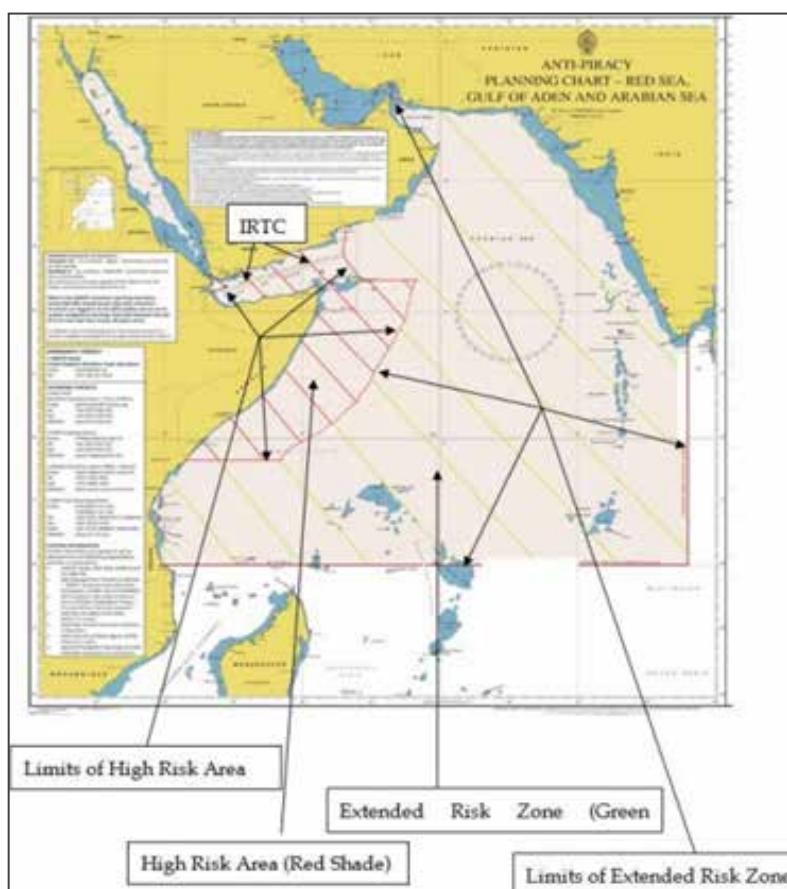

Figure A3: IBF List of Warlike and High Risk Designations

⁵ Ibid.

Joint War Committee Hull War, Piracy, Terrorism and Related Perils Listed Areas

JWC WRA:

The Joint War Committee (JWC) “comprises underwriting representatives...representing the interests of those who write marine hull war business in the London market.”⁶ This insurance industry body meets quarterly to define and review hazardous “war risk areas” (WRAs) around the globe—areas inside of which vessels must pay additional premiums to compensate for the elevated risk; these WRAs are then published as the “Hull War, Piracy, Terrorism and Related Perils Listed Areas” and integrated into hull war risk policies around the world.⁷

Territorial Waters:

- Eritrea, but only south of 15° N
- Somalia

Indian Ocean/Arabian Sea/Gulf of Aden/ Gulf of Oman/Southern Red Sea:

The waters enclosed by the following boundaries:

- a) On the north-west, by the Red Sea, south of latitude 15° N;
- b) On the west of the Gulf of Oman by longitude 58° E;
- c) On the east, longitude 78° E; and
- d) On the south, latitude 12° S.

This does not include the coastal waters of adjoining territories up to 12 nautical miles offshore unless otherwise provided.⁸

Gulf of Guinea

IBF HRA

The International Bargaining Forum designates only one zone in the Gulf of Guinea: the High Risk Area. There are no West African analogues to the WOA or XRZ near the Horn of Africa. The HRA is composed of the territorial waters of Nigeria and Benin, which extend 12 miles from the coast, as well as their ports and inland waterways—excepting secure berthing areas and guarded port areas.⁹

Figure A4: JWC Listed Area for Indian Ocean (JWC WRA)

JWC WRA

The Joint War Committee War Risk Area in the Gulf of Guinea covers the territorial waters of Nigeria, Benin, and Togo, as well as their exclusive economic zones (EEZs) north of the 3rd parallel north (3°N).

Figure A5: JWC WRA, Gulf of Guinea

APPENDIX B – NAVAL COSTS, EAST AFRICA

Military Assets

The tables below detail the cost calculations described in the main text. First, for naval vessels, helicopters and patrol aircraft, and unmanned aerial vehicles alike, the cost of operating a single unit for one year is estimated. Each such “unit cost” is calculated for an archetypal vessel class or model, which then serves as the cost estimate for all assets of that type. For example, all frigates are treated as Oliver Hazard Perry-class frigates, all helicopters as SA 341 Gazelles, and so on. This approximation is necessary given the variety of assets deployed within multinational forces and by the myriad individual countries. Then, for each archetype, the unit cost is multiplied by the average number of assets of that type conducting counter-piracy operations in the Western Indian Ocean Region during 2014. Note that lower operating costs for independent deployers are factored into the cost calculations. Finally, the costs of these different asset types are summed, giving a grand total cost of operating military assets.

Table B1: Ships

	Frigate ¹⁰ (Oliver Hazard Perry class)	Destroyer (Arleigh Burke class)	Amphibious (Galicia class)	Patrol (Sukanya class)	Support
Daily Fuel Use (gal)	21,640.55 ¹¹	4,909.90908 ¹²	15,372.4 ¹³	4,797.213509 ¹⁴	16,911.8003 ¹⁵

Subtotal:	\$638,310,366.70				

10 In recognition of the fact that many navies have lower operating costs than, for example, the United States or the United Kingdom, independent deployer assets are estimated to operate at one-third of the cost of coalition assets.

11 This cost was calculated using data from Navy Site. “The FFG 7 Oliver Hazard Perry-class,” Navy Site, <http://navysite.de/ffg/ffg7class.htm> (accessed May 7, 2015).

12 Calculated using data from Global Security. “DDG-51 Arleigh Burke – Specifications,” GlobalSecurity.org, <http://www.globalsecurity.org/military/systems/ship/ddg-51-specs.htm> (accessed May 7, 2015); Schuyler Null, “Defense Sustainability: Energy Efficiency and the Battlefield,” Global Green USA (2010), <http://www.globalgreen.org/docs/publication-112-1.pdf>.

13 This cost was calculated using data from the Naval Institute. Eric Wertheim, *The Naval Institute Guide to Combat Fleets of the World: Their Ships, Aircraft, and Systems*, 15th ed. (Naval Institute Press, 2007).

14 This cost was calculated using data from the Naval Institute. Ibid.

15 This cost was calculated using data from the Naval Institute. Ibid.

16 This report assumes that operating cost is roughly proportional to crew size. Using the complement and operating cost of a frigate as a baseline, operating costs for other assets can be estimated, provided that the crew size is known. For example, a vessel with twice as many personnel as a frigate would have double the operating cost. The Adjustment Factor is this ratio between asset crew size and frigate crew size. The estimated monthly operating cost of a given asset is thus simply the operating cost of a frigate multiplied by this Adjustment Factor.

17 John Knott cites a frigate monthly operating cost of £1 million. Converting to U.S. dollars using the 2009 average exchange rate, as reported by OANDA, generates a monthly cost of about \$1,584,949. Adjusting for inflation using the U.S. Bureau of Labor Statistics tool yields a final monthly operating cost of \$1,734,071. John Knott, “Somalia: Clan Rivalry, Military Conflict, And the Financial and Human Cost of Piracy,” *Mondaq*, 17 March 2009, <http://www.mondaq.com/x/76272/Marine+Shipping/Somalia+Clan+Rivalry+Military+Conflict+And+The+Financial+And+Human+Cost+Of+Piracy>; “Average Exchange Rates,” OANDA, <http://www.oanda.com/currency/average> (accessed May 7, 2015); “CPI Inflation Calculator,” U.S. Bureau of Labor Statistics, <http://data.bls.gov/cgi-bin/cpicalc.pl> (accessed May 7, 2015).

SHADE

The calculation for SHADE conference costs was straightforward: we estimated the number of delegates traveling to the conferences—excluding those attendees already in the area—and the costs associated with that travel, as well as the cost of accommodations once in Bahrain. The sum of these travel and accommodation costs for a given conference was then multiplied by the number of conferences in 2014, yielding a total cost for the year.

Table B5: Attendance²²

Conference	Month	Delegates	Countries
31st	March	90	33
32nd	June	140	32
33rd	September	103	32
34th	December	108	34
Average, Total:		110.25	32.75
Average, International: ²²		82.6875	

Table B6: Travel

Region	Fraction ²³	Count	Flight Cost ²⁴ (\$)	Flight Expenditure (\$)
Europe	0.47	39	793	30,927
N. America	0.22	18	1,238	22,284
Asia	0.12	10	415	4,150
Africa	0.19	16	633	10,128
TOTALS	1	83		67,489

Table B7: Accommodation

	Travelers	Daily Cost (\$)	Days	Accommodation Expenditure (\$)
International	83	272	3	67,728

Table B8: Total

Cost Per Conference ²⁵ (\$)	135,217
Number of Conferences	4
Total Cost (\$)	540,868

²² This number assumes that 75% of participants are international, i.e., must travel to the conference and pay for accommodations.

²³ As this information was not available for the conferences in 2014, we used the continental proportions of attendance from the 2012 conferences.

²⁴ This number is based on ticket prices for flights to Bahrain from a representative airport in each region, using the dates of the June conference. Prices represent the cheapest fare returned by a *kayak.com* search conducted in April 2014, although many attendees in fact fly business class and/or get governmental or corporate fares.

²⁵ This is the sum of travel costs and accommodation costs for all international attendees.

APPENDIX C – INCREASED SPEED, EAST AFRICA

Table C1: Speeds and Costs²⁶ (all speeds in knots)

Vessel Length (m)	120–200	200–300	300+
<i>Cargo</i>			
Observed Global Average Speed	12.94	13.21	14.88
Observed Average Speed in WIOR	13.14	14.04	17.4
Increased Speed Margin	0.5	0.75	1.0
Increased Speed Threshold	13.44	13.96	15.88
<i>Tanker</i>			
Observed Global Average Speed	12.77	13.09	12.41
Observed Average Speed in WIOR	13.15	13.19	14.06
Increased Speed Margin	0.5	0.75	1.0
Increased Speed Threshold	13.27	13.84	13.41
380cst bunker, Rotterdam (\$/Tonne)	\$532.14		
380cst bunker, Singapore (\$/Tonne)	\$559.68		
WIOR traffic 380cst bunker, equal-weight average (\$/Tonne)	\$545.91		

The essence of our increased speed cost calculations was a comparison between ships' behavior inside the BMP4 HRA, where piracy is a threat, and the rest of the world, where for the most part it is not.

Utilizing the global set of AIS data for a single day in June 2014, we compiled the average reported speed for each vessel of interest not transiting the HRA.²⁷ To do so, we broke our AIS data into six vessel categories based upon the designated vessel type and length. In the absence of data relating to specific vessel type and dead weight tonnage, we used length as a proxy. This allows us to account for the variation in average steaming speeds between the various vessel types and increases the accuracy of our calculations. Table C2 demonstrates the variation in specific vessel type within the cargo category by length.

Table C2: Cargo Vessel Types By Length²⁸

120–200m	Bulk Carrier Handymax/Handysize PCC Vehicle Carrier General Cargo Small Feeder/Feeder/Feedermax Container
200–300m	Panamax Bulk Carrier Panamax Container PCTC/LCTC/ULVC Vehicle Carrier
300m +	Capemax Bulk Carrier Post Panamax/New Panamax/ULCV Container

In previous reports we did not use vessel length categories, but these divisions provide a more accurate representation

26 All speed data in table was calculated using a global AIS sample containing all AIS reports from June 5, 2014.

27 "Vessels of interest" excludes, as usual, all ships less than 120 meters in length. Here, we also omitted all vessels moving at a speed below 8 knots, in order to eliminate any vessels entering or exiting port, in keeping with the attempt to characterize the behavior of vessels fully underway. Last, we excluded any reported speeds above 25.9 knots as unrealistic for commercial traffic.

28 "Our Fleet," Wallenius Lines, <http://www.walleniuslines.com/Fleet/Fleet-List1/> (accessed May 7, 2015); "GC0491 – General Cargo," Vessel for Sale, <http://www.vesselforsale.net/homepage/dry-cargo/general-cargo/gc0491-general-cargo.html> (accessed May 7, 2015); "General Cargo," Marin, <http://www.marin.nl/web/Ships-Structures/Merchant-vessels-Work-boats/General-Cargo.htm> (accessed May 7, 2015); "Feeder Vessel Data Sheet: Size Comparison," Containership-info.net, http://www.containership-info.com/misc_publ_feedergrowth.pdf (accessed May 7, 2015).

of increased speeds as a proxy for vessel type. This is an attempt to account for the variation in “optimal” steaming speeds between, for example, an archetypal bulk carrier and an archetypal container vessel, two very different types of ships lumped together within the same AIS categorization.

After grouping the observed vessels by type and by length,²⁹ we calculated an average speed for each group, which we identified as the speed ships travel when not threatened by pirates. Ships in the HRA observed traveling above that speed, then, could be considered to be modifying their behavior specifically in response to the risk of piracy. However, in order to ensure that we excluded to the greatest degree possible any ships traveling slightly above the optimum for other purely commercial reasons, we also introduced “threshold” values. Only ships traveling above the empirical optimum by a certain minimum amount—the thresholds—were considered to be definitively increasing speed due to piracy.³⁰ Only ships meeting this criterion were included in our final cost of increased speeds, which was simply the value of the extra fuel these ships burned in order to maintain speeds above the optimum.³¹

Bunker Fuel Prices							2014 Averages

²⁹ While AIS data includes some ship type information, most salient here identifying a ship as “cargo” or “tanker”—the categories are very broad. For example, a bulk carrier and an ultra-large vehicle carrier will both be classified merely as “cargo” despite their enormous physical differences. In an attempt to mitigate this problem, we used length as a proxy for type, further differentiating within the “cargo” population. Although this is an inherently imprecise approach, observable discrepancies in behavior between these length groups suggest that it is not entirely misguided. See Table C2 (Cargo Vessel Types by Length) for more.

³⁰ For example, a small (120–200m) cargo vessel has an expected optimum speed of 12.94 knots, and a 0.5-knot threshold. A 120m cargo ship traveling 13.0 knots would not be included in our set of ships modifying their behavior explicitly due to piracy, and as such the excess fuel it expended traveling above the optimum speed would not be tabulated as a “cost of piracy.” That hypothetical cargo ship would need to be traveling at or above 13.44 knots ($12.94 + 0.5$) in order for its fuel costs to be considered a “cost of piracy.”

³¹ That is, the difference between the amount of fuel expended to maintain the higher speed and the lesser amount of fuel which would be needed to travel at the optimum speed—only the cost of the excess fuel expenditure.

	380cst bunker, \$/Tonne, Rotterdam	532.14
	380cst bunker, \$/Tonne, Singapore	559.68
	WIOR traffic equal-weight average	545.91

To provide a baseline for comparison with the 2013 cost of increased speeds, we have included the tables below. In these tables, we ran the calculations for 2013 increased speed costs in accordance with the vessel length granularity added in the 2014 report, in addition to using the observed global speed as an empirically derived optimum. Using these numbers, we estimate that the cost of rerouting decreased by 40% from 2013.

APPENDIX D – REROUTING

Western Indian Ocean Region

Gulf of Aden–Southern India Route

The methodology for calculating the cost of rerouting for traffic between the Gulf of Aden and the southern tip of India remained consistent with previous reports. However, we extended our analysis to include the Persian Gulf–South India route, addressed later in this appendix. Our baseline traffic patterns were based on 2004–2005 commercial shipping data from “A Global Map of Human Impact on Marine Ecosystems” by Benjamin S. Halpern et al.³² The 2014 traffic patterns were calculated using AIS data samples purchased from exactEarth. To analyze the Gulf of Aden route, we defined a number of cartographic zones, each a square three degrees of arc in length, along the direct route between the southern tip of India and the Gulf of Aden, and along the indirect route hugging the Indian and Pakistani coastline of the Indian Ocean. We then calculated what percentage of ships in our sample enters each zone, and used those figures to assess relative traffic flows.

Table D1: Zone Definitions

	Vertices (latitude °N, longitude °E)				
	Zone	NW	NE	SE	SW
Direct Route	D1	15, 56	15, 59	12, 59	12, 56

Persian Gulf–Southern India Route

To analyze rerouting trends we divided our AIS data into three groups based on vessel speed: 8–13 knots, 13–17 knots, and 17–25 knots. These were further subdivided into tankers and cargo vessels. We expected to see some difference in behavior between fully laden tankers and those in ballast. To test this we split the tanker data into vessels with northwest and southeast headings, under the assumption that vessels with a southeast heading would be full of petro-product, while those with a northwest heading would be in ballast. This data was then processed by a geospatial analysis program, which was used to generate heat maps of the vessel traffic.

**Figure D2: Traffic patterns for both NW- and SE-heading transits demonstrate that slower vessels hug the coastline, avoiding the more direct route.**

We used the average speeds for vessels traveling the direct 1405nm route and that of vessels along the more circuitous 1517nm route to calculate the indirect cost incurred by traveling the shorter distance at higher speeds, rather than steaming at the more fuel-efficient speed over the shorter distance.³⁴

³³ The percentage represents the percentage of traffic that falls within each zone as a fraction of the total traffic in our data sample.

³⁴ Jeppesen Integrated Maritime Suite V1.2.0.146.

Table D3: Fuel Calculations

	Cargo (120–200m length)			Tanker (120–200m length)		
	Direct Route	Circuitous Route	Direct Route, Optimal Speed	Direct Route	Circuitous Route	Direct Route, Optimal Speed
Vessel Speed (knots)	15	13	13	14.5	13	13
Hourly Fuel Consumption (tons)	1.497942	0.791518	0.791518	1.673144	1.125888	1.125888
Transit Time (Hours)	93.67	116.69	108.08	96.90	116.69	108.08
Total Fuel Consumption (tons)	140.31	92.36	85.55	162.13	131.38	121.69
Fuel Cost	\$76,598	\$50,421	\$46,701	\$88,507	\$71,722	\$66,430
Per-Vessel Cost	\$3,700			\$5,300		

We calculated a conservative estimate of these rerouting costs using these sums. AIS data was used to calculate the number of transits conducted by vessels within the 8–13 knot vessel speed group. The mean vessel length for these vessels is within the 120–200m group, and this speed group was most evidently engaged in rerouting based on our analysis.

The new analysis of the Persian Gulf to South India route used vessel speeds based upon observed mean speed over ground, as reported in AIS data captured on March 25, 2015,³⁵ for vessels whose transit fell along one of the routes we were examining. From there we utilized maritime navigation software to measure the length of both of these routes.³⁶ The same equations used to calculate the costs associated with increased speeds were used to calculate the fuel costs incurred by small cargo and tanker vessels steaming at the designated speeds along the designated routes. We estimated the cost vessels incur utilizing these behaviors as the difference between the cost of their current practices and the cost of traveling at optimal speeds along the shortest route.

Table D4: Persian Gulf–Southern India Rerouting Calculations

Persian Gulf to Southern India Rerouting Calculations			
Total Number of WIOR Transits	72,600	Selected AIS hits in Area of Interest (AoI)	209,930
Number of AIS hits in WIOR	1,123,311	% of AIS hits in the AoI	18.69%
Number of transits in the AoI		13,568	
% of slow vessels in the AoI	40.9%	Number of slow tanker transits in AoI	2,672
Number of slow vessel transits in the AoI	5,550	Number of slow cargo transits in AoI	2,060
% of transits along direct route in AoI		0.30%	
Number of slow tankers rerouting	1,870	Cost for Slow Tankers	\$9,898,521
Number of slow cargo rerouting	1,442	Cost for Slow Cargo	\$5,364,092
Total Estimated Cost of Rerouting		\$15,263,000	

³⁵ OBP acquired new software tools for observing ship behavior in 2015. Although the central analysis throughout the report relies on AIS data from 2014, in select places observations made in 2015 were used to inform vessel behavior and facilitate analysis of traffic patterns.

APPENDIX F – NAVAL COSTS, WEST AFRICA

Naval Acquisitions

Below are naval acquisitions made by Gulf of Guinea states in 2014. Acquisitions are neither generally made in one lump sum nor are vessels delivered the same year that they are ordered. Therefore, it is impossible to determine how much of a payment was made for each purchase in 2014.

Table F1: Delivered Vessels

Buyer Country	Seller Country	Vessel Type	Delivery Year
Benin	United States	1 Metal Shark boat	2014
Cameroon	China	2 32-meter patrol boats	2014
Cote d'Ivoire	France	2 RPB33 patrol boats	2014
		30 inflatable speed boats	2014-2015
Nigeria	Netherlands	5 K-47 boats	2014
	Nigeria	1 Seaward Defence Boat	2014
	Ireland	1 P22 patrol vessel	2014
	South Africa	2 17-meter Sentinel Fast Patrol Vessels	2014

Donated Vessels			
Nigeria	United States	1 Hamilton class cutter	2014
		1 Survey Ship	2014

Naval Operating Costs

Our analysis of operating costs for navies in West Africa draws from two reports. The first is from a UN report on Benin and Nigeria's joint operation called "Operation Prosperity." It explains, "Benin's contribution to the operation is estimated at CFA 234,347,490 per month (about \$466,000) which is equivalent to 5% of the total cost of the operation."⁴³ The UN report also noted that Nigeria's contribution was two maritime vessels, two interceptor boats, and two helicopters.

Table F2: Operation Prosperity Contributions

Country	Amount	Share
Benin	\$466,000.00	5%
Nigeria	\$8,854,000.00	95%
Total	\$9,320,000.00	100%

The second source comes from an article where Nigeria's Chief of Naval Staff, Vice Admiral Dele Ezeoba, offers a rare glimpse at operating costs. He noted that "putting eight ships at sea for the exercise for seven days, they were looking at about N600 million, which includes personnel costs, fuel, spare parts and other auxiliary requirements."⁴⁴

Table F3: Daily Operating Cost Calculations

7 days, 8 ships	\$3,634,684.80
1 day, 8 ships	\$519,240.69
1 day, 1 ship	\$64,905.09
30 days, 8 ships	\$15,577,220.57
30 days, 4 ships	\$7,788,610.29
Hazard Pay in 2014 Due to E. Africa HRA	\$71,650,000

These two sources seem to confirm each other, as they are within the same range for four ships in one month. We can extrapolate from this data that it costs \$1,065,389.71 to operate two helicopters. Using the one day, one ship cost of \$64,905.09, OBP built out the cost of deployed naval vessels in West Africa. Our estimation is that Nigeria has between four to seven vessels on patrol a day while Ghana, Cameroon, and Angola all operate one vessel per day on average. Therefore, there are seven to ten vessels operating within the Gulf of Guinea at an annual cost of between \$165,832,504.95 and \$236,903,578.50.

⁴⁴ "Navy Can Secure Nigerian Waters – Ezeoba," *Online Nigeria*, 17 November 2012, <http://news.onlinenigeria.com/nigeria-news/5734-navy-can-secure-nigerian-waters-%E2%80%93-ezeoba.html>.

Table F4: Total Operating Cost Calculations

# of Ships	Per Day	Per Month	Per Year
1	\$64,905.09	\$1,947,152.70	\$23,690,357.85
7	\$454,335.63	\$13,630,068.90	\$165,832,504.95
10	\$649,050.90	\$19,471,527.00	\$236,903,578.50

Naval Capacity-Building Deployments

The tables below detail the cost calculations used for foreign naval assets operating in the Gulf of Guinea (GoG). First, for naval vessels and helicopters—there were no patrol aircraft or unmanned aerial vehicles involved in these operations—the cost of operating a single unit for one year is estimated. Each such “unit cost” is calculated for an archetypal vessel class or model, which then serves as the cost estimate for all assets of that type. For example, all frigates are treated as Oliver Hazard Perry-class frigates, all helicopters as SA 341 Gazelles, and so on. This approximation is necessary given the variety of assets deployed by myriad individual states. Then, for each archetype, the unit cost is multiplied by the average number of assets of that type conducting capacity-building operations in the GoG across 2014. Finally, the costs of these different asset types are summed, giving a grand total cost of operating military assets.

Table F5: Ships⁴⁵

	Frigate (Oliver Hazard Perry class)	Destroyer (Arleigh Burke class)	Amphibious (Galicia class)	Patrol (Sukanya class)	Support (Fusu class)
Daily Fuel Use (gal)	21,640.55	4,909.91	15,372.40	4,797.21	16,911.80

APPENDIX H – TRANSITS

A transit, generally speaking, is a passage through a particular, demarcated area, or an entry into the area, and an exit from it. The concept of a “transit” is used as a very specific term throughout this report, because it is not just important for our *ex post facto* analysis, but this term is additionally utilized by maritime stakeholders in the conduct of their business. For example, hull war risk breach premiums are paid on a per-transit basis, just as a PCASP team may be contracted for a single transit. Some labor costs are also tied to transits. Accordingly, determining numbers of transits through various regions is an integral part of our analysis. Because of differences in both shipping patterns and available information, we were required to employ different approaches for calculating transit figures in both East and West Africa.

Automated Identification System (AIS) Data

Statistical analysis of AIS data was the primary method used to calculate transits for the WIOR, and one of three methods used in West Africa. AIS data uses a network of transceivers and geopositioning devices to track and identify vessels, particularly in the interest of avoiding collisions or other maritime accidents. AIS capability is mandatory for vessels over a certain tonnage, but its use is not, and a vessel master can turn the system on or off at will. Each AIS report, or “ping,” typically contains a vessel’s identification information—name, IMO number, vessel type, etc.—along with its position, speed, course, destination, physical dimensions, and hazardous cargo information.

OBP purchased four datasets from exactEarth, each spanning four days in a different quarter of 2014.⁴⁷ These datasets comprise all AIS pings transmitted during those timespans from within our areas of interest off West Africa and in the WIOR.⁴⁸ Additionally, we received a global sample containing all pings from all relevant vessels for one full day in 2014.⁴⁹ These data were supplemented by exactEarth’s ShipView vessel tracking software, which enabled us to observe ship behavior, as reported via AIS, in real time.

⁴⁷ The four data sets from 2014 covered the following (inclusive) ranges: January 28–31, April 29–May 2, July 14–17, and October 14–17.

⁴⁸ For a detailed description of these areas, please see Appendix A.

⁴⁹ Here “relevant vessels” means all ships 120 meters or more in length, as usual, which additionally are traveling no slower than 8 knots, in order to exclude stationary, berthed, and in-port vessels. The sample came from June 15, but that date has no particular significance.

Cleaning the Data

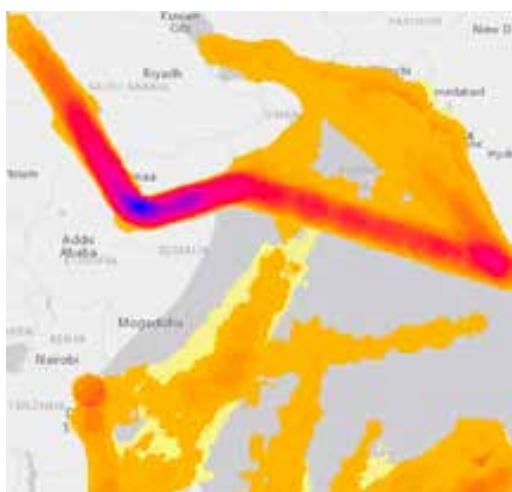

AIS data are inherently “dirty.” The absence of reporting requirements or standards, along with manual entry of information, admits both accidental errors and intentional falsifications. Despite this, AIS remains one of the most reliable avenues for developing a picture of maritime traffic, and is used by industry and governments alike; nonetheless, inconsistencies and inaccuracies within the data do pose hurdles to analysis.

As such, our preliminary task was to clean the data by removing spurious, erroneous, or irrelevant reports. First, we eliminated all pings listing a common “dummy” value for the ship’s Maritime Mobile Service Identity (MMSI): 123456789, 111111111, 222222222, and so on.⁵⁰ Second, any incomplete AIS reports lacking an entry for vessel name, IMO number, or length were excluded. We also removed all pings claiming a vessel length that was either ineligible or implausible, such as below 120 meters or above 400 meters. Last, in keeping with our focus on commercial shipping, we removed all reports listing a vessel type other than “cargo” or “tanker.”⁵¹ The remaining pings constituted our dataset for analysis.

Transits: East Africa

Commercial passages⁵² through the WIOR are for the most part true “transits”: journeys that both originate and terminate elsewhere. Only a small fraction of vessels make port calls or other stops within the area of interest; roughly

speaking, the Gulf of Aden and the western Indian Ocean north of Madagascar.⁵³ As the heat map below shows, most traffic in the region flows to or from the Suez Canal, with by far the greatest density of ships occurring in the Internationally Recommended Transit Corridor, a shipping highway of sorts running the length of the Gulf of Aden, which was created in response to the rise of Somali piracy.⁵⁴ Some traffic rounds the Cape of Good Hope while other ships skirt the southern tip of India, but the essential feature of nearly all traffic in the region is that it is merely “passing through” the area.⁵⁵ This holds true for the tanker-dominated traffic into and out of the Persian Gulf, which contains many active, major ports but lies beyond the BMP4 HRA.

This has important implications for our analysis. In the absence of calls on ports, stays in berthing zones, or other behaviors that would leave a paper trail, our East Africa assessment relies heavily on AIS data. However, we

utilized built-to-purpose algorithms, applied via R, for counting both individual vessels and overall numbers of transits, and later consulted with industry experts to confirm the results. For simplicity we have rounded the WIOR transit estimate to 72,600.

⁵⁰ For more information about MMSIs, please see “Navigation Center Points of Interest,” U.S. Coast Guard Navigation Center, <http://www.navcen.uscg.gov/?pageName=mtMmsi> (accessed May 11, 2015).

⁵¹ The cargo and tanker categories correspond to values 70–79 and 80–89, respectively, for the “Ship Type” field in an AIS report. Other, excluded values cover everything from tugboats, yachts, wingships, naval vessels, etc. For more information, please see “Table 11. Codes for Ship Type” at: Eric S. Raymond, “AIVDM/AIVDO Protocol Decoding, Version 1.50,” April 2015, <http://catb.org/gpsd/AIVDM.html>.

⁵² As is generally the case throughout this report, our focus on commercial, international shipping means that our analysis excludes all vessels less than 120 meters in length.

⁵³ See Appendix A for a detailed discussion of the various regions considered within this report.

⁵⁴ “Update to Internationally Recommended Transit Corridor (IRTC),” MARLO, 3 February 2009, <http://www.cusnc.navy.mil/marlo/Guidance/Corridor.htm>.

⁵⁵ For example, 2014 saw 16,000–17,000 passages through the Suez Canal, yet the Port of Djibouti, one of the largest in the area, recorded only 1,694 calls, of which 17% were naval vessels. Mombasa, another major regional port, had only 1,768 calls in 2013, according to the Kenya National Bureau of Statistics Statistical Abstract. “Monthly Number & Net Ton by Ship Type, Direction & Ship Status,” Suez Canal Traffic Statistics, <http://www.suezcanal.gov.eg/TRstat.aspx?reportId=1> (accessed May 11, 2015); “Vessel Calls Per Category (2010-2014),” Port de Djibouti, <http://www.portdedjibouti.com/PDF/2014%20VESSEL%20CALL%20PER%20CATEGORY.pdf> (accessed May 11, 2015); Kenya National Bureau of Statistics, *Statistical Abstract 2014* (Nairobi: Kenya National Bureau of Statistics, 2014), 174, http://www.knbs.or.ke/index.php?option=com_phocadownload&view=category&download=609:statistical-abstract-2014&id=106:statistical-abstract&Itemid=1177.

Table H1: AIS-Based Transit Estimates

	81,300
	89,800
IBF HRA Transits	17,900
	20,000
	22,000

Transits: West Africa

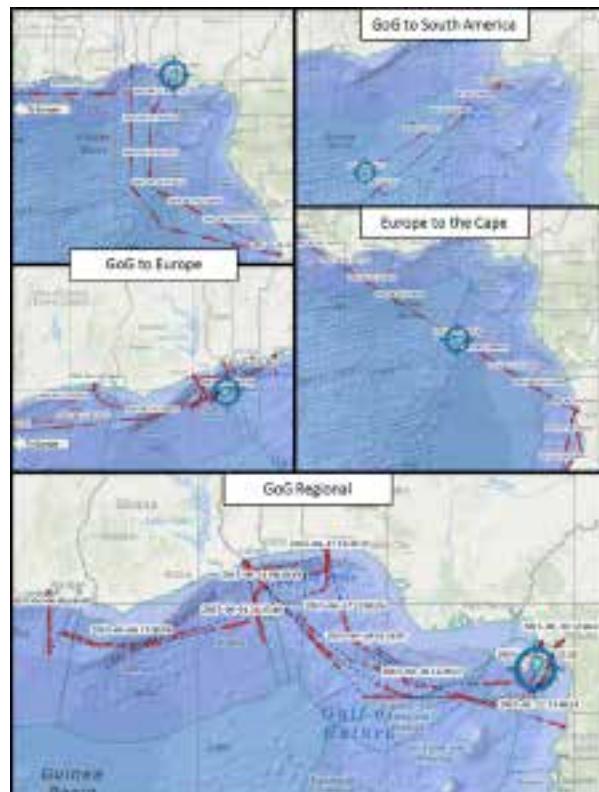

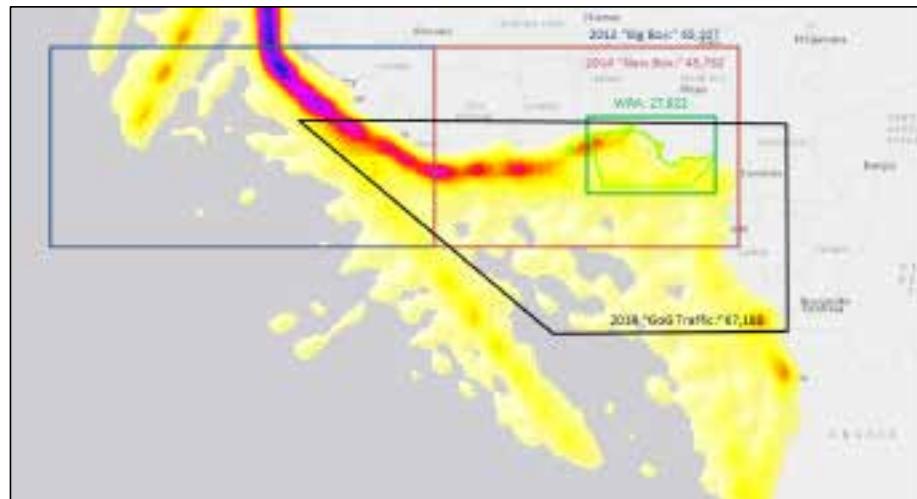

Calculating West African transits is a complex endeavor given the diversity of traffic and the difficulty of defining what exactly constitutes a “transit” in the Gulf of Guinea. Traffic in the area frequently both originates and terminates within the region. Vessels also commonly make multiple port calls within the gulf, traveling relatively short distances in between. Ships calling on port may also be required to spend extended periods of time drifting or at anchor while waiting for a berth.

Figure H2 illustrates several different types of transits in the GoG, which can be roughly grouped into a few basic categories: vessels transiting between the GoG and Europe or southern Africa; those traveling to and from South America; ships bypassing the region almost entirely as they transit between Europe and the Cape of Good Hope; and, finally, Gulf of Guinea intra-regional traffic, which makes up a significant portion of total traffic volume.

The variety of behavior, long wait times, and multiple port visits make the algorithms used to calculate WIOR transit numbers less viable in West Africa. As a result, we employed several different methods of assessing transit numbers, then cross-checked results against each other. Specifically, we utilize AIS pings, port calls, and estimated secure-area visits.

AIS-Based Estimation

We calculated transit numbers for several precisely-defined zones designated to represent our specific West African areas of interest. These areas are depicted in Figure H3.

**Figure H2: AIS-Based Transit Estimates****Figure H3: Areas of Interest. The red “New Box” demarcates the Gulf of Guinea, as defined for this report**

The 2013 report utilized, as its primary area of interest, the zone labeled in Figure H3 as the blue “Big Box.” We replicated the “Big Box” transit calculations for this year, but ultimately elected to shrink our area of interest to the red “New Box” zone. We determined that the 2013 “Big Box” captured too much traffic going to and from areas unaffected by piracy and far from the piracy risk areas. We also tested the zone bounded by the black, 2014 “GoG Traffic” box, but rejected it as also capturing an excess of unrelated traffic. The other area for which we calculated transit numbers is the Lloyd’s Joint War Committee WRA, identified by the smaller green rectangle in Figure H3.

ExactEarth reporting standards dictate that a three-day period without AIS reporting indicates that a vessel has made a port call or otherwise concluded its trip. OBP similarly considered a transit to be terminated after 72 hours without an AIS report. Herein lies a methodological limitation for the Gulf of Guinea, as vessels calling on ports in the region frequently experience berth waiting times in excess of four days. This wait period can result in unintentional double-counting, as a single transit may register twice: once when traveling from origin to berth waiting area, and again several days later going from waiting area into port. This in turn can inflate transit numbers, particularly for AIS pings sent from within the WRA and near ports. We also note that AIS data has limited accuracy due to the propensity of vessels, in accordance with the *“Guidelines for Owners, Operators, and Masters for Protection against Piracy in the Gulf of Guinea Region,”* to turn off their AIS transmitters when in piracy-prone waters. These limitations underline the importance of employing multiple means of calculation.

Our AIS-based estimates of transits are 27,900 for the WRA and 45,800 for the refined GoG “New Box”, for which we allow a 10% margin of error above and below this value. The IBF HRA is simply too small to practically attempt a transit calculation on the basis of AIS reports. In the interest of a conservative estimate, we use the lower bound as our final estimate.

Table H2: AIS Transit Estimates

	45,800
	50,500
WRA Transits	25,000
	27,900
	30,800
IBF HRA Transits	N/A
	N/A
	N/A

Port-Visit-Based Estimation

The second method we used to calculate transits in the Gulf of Guinea was analysis of port visits. OBP bought 2014 port-call data from Genscape’s Vesseltracker service for 16 major West African ports. The data included individual vessel counts, as well as total port visits, broken down by vessel type and length. Given the nature of vessel traffic in the Gulf of Guinea, a single call on port should be a serviceable proxy for a single transit. The data were cleaned to exclude all vessels not categorized as cargo, tanker, unknown, or other. We then summed the number of visits to the ports enclosed in each zone to estimate the number of transits in the Gulf of Guinea, the JWC WRA, and the IBF HRA. Port visit numbers are mapped in Figure H4.

Analysis of port data yielded an estimated number of transits between 34,606 and 43,935 for the Gulf of Guinea as a whole. For the WRA, the range is 17,140–20,949 while the IBF HRA totals 14,842–18,607 transits. It is worth noting that some of the listed ports fall outside the geographic area employed in the AIS-based transit calculations. It is equally important to note that the 16 ports for which we have data are not the only ports within our area of interest. Consequently, the estimate for transits within the entire Gulf of Guinea may be inflated, while those for the WRA and IBF HRA may underestimate traffic levels.

Table H4: Port Visit Transit Estimates

Gulf of Guinea Transits	43,900
	34,600
WRA Transits	20,900
	17,100
IBF HRA Transits	18,600
	14,800

The dataset also included the number of individual vessels that called at each port. This data was cleaned and organized in a manner identical to the port visit data. The total number of individual vessels relevant to our report is between 5,797 and 6,058. The average number of port visits per vessel for 2014 is estimated at 7.5.

Secure-Area-Based Estimation:

The final method used to estimate transit numbers utilized AIS observation of vessels within secure areas in the Gulf of Guinea. OBP used ShipView to download data for stationary and drifting commercial vessels⁵⁶ in the Gulf of Guinea on ten days within the first quarter of 2015.⁵⁷ In this specific context we utilized data from 2015, as the 2014 equivalent was not available, and we presume that vessel behavior did not shift dramatically in the first quarter of 2015 as compared to 2014.

Using geospatial analysis software, we identified how many vessels appeared within each secure area; we averaged and then annualized these figures, as displayed in Table 5. This method estimates 19,400–16,600 transits for the Gulf of Guinea, 18,800–16,000 in the WRA, and 11,400–13,000 in the IBF HRA. Note that in these calculations, the only difference between the WRA and the GoG is the inclusion of Ghanaian secure areas, as all others examined fall within the WRA.

Table H5: Secure Area Transit Estimates

Gulf of Guinea Transits	19,400
	16,600
WRA Transits	18,800
	16,000
IBF HRA Transits	13,000
	11,400

Analyzing this data requires recognizing that the number of vessels that exit and enter these areas each day is some function of the total number of vessels in the area each day. This function is assumed to be related to the average number of days that vessels spend in each area. We estimate the average stay in the Nigerian Secure Anchorage Area (SAA) to be five days, and the average stay in the other secure areas to be between four and five days. STS zone visits are likely to last only a single day, as that is sufficient time to conduct a ship-to-ship transfer. Variation 1 and Variation

56 “Drifting commercial vessels” refers to those vessels at least 120 meters in length reporting a speed no greater than 4 knots.

57 This data was captured on the following dates: 12/30/2014, 1/1/2015, 1/8/2015, 1/16/2015, 2/2/2015, 2/12/2015, 2/25/2014, 3/3/2015, 3/11/2015, and 4/6/2015.

2 represent the most reasonable assumptions, based on our research. It is important to note that these estimates represent the lower bound of transit numbers, since a significant percentage of vessels do not utilize the secure areas despite the security advantages they provide.

Final Transit Estimation:

To reach the final figures for Gulf of Guinea transits we averaged the estimates from each of the three methods. We used the high and low bounds for all but the AIS transit estimate, for which we used the lower bound. The final estimate for the number of transits in each area is listed in Table H7.

Table H7: Transit Estimation Summary

	AIS Estimate	Port Visit Estimate		Secure Areas Estimate		Final Estimate
Gulf of Guinea Transits	41,000	43,900	34,600	19,400	16,600	30,900
WRA Transits	25,000	20,900	17,100	18,800	16,000	19,600
IBF HRA Transits	N/A	18,600	14,800	13,000	11,400	14,500

APPENDIX I – INSURANCE

The methodology used in this year's report represents a slight departure from last year's, which was based on transits rather than a share of the insurance market. The method used this year is simpler, but produces a comparable final total. This year's assessment of 2013 War Risk insurance costs estimated the cost to within \$4-\$7 million of last year's methodology for the WIOR and GoG respectively.

Cost of War Risk Insurance

WIOR

The first step in extrapolating the cost of War Risk insurance in the WIOR was to calculate the total amount of premiums paid by Hellenic War Risk Club (HWR) members in the WIOR WRA. In 2013, the HWR covered 2,259 member vessels. The breach premiums paid for vessels that transited a designated WRA totaled \$17.69 million, constituting 88.5% of all premiums.⁵⁸ According to the HWR, of the 6,000 total WRA transits declared by its members worldwide in 2013, about 50% were through the WIOR WRA.⁵⁹ Thus, assuming that all breach premiums are similar, the total cost of transiting the WIOR WRA for HWR members was approximately \$8.845 million.

The second step was to estimate the HRW's share of all breach premiums in the WIOR WRA. For this section's purposes, only vessels with a volume of least 5,000 gross tons are considered. The Baltic and International Maritime Council (BIMCO) estimates that there were approximately 27,827 such vessels globally in 2014, giving the HWR members' 2,259 vessels a global market share of 8.1%. Based on this number, and the estimated value of \$8.845 million collected from HWR members in the WIOR, the total amount of war risk premiums in the WIOR WRA was approximately \$109 million in 2013.

GoG

The first step in extrapolating the cost of War Risk insurance in the Gulf of Guinea was to calculate the total amount of premiums paid by HWR members in the GoG WRA. In 2013, the HWR covered 2,259 member vessels. The breach premiums paid for vessels transiting a designated WRA totaled \$17.69 million, constituting 88.5% of all premiums.⁶⁰ According to the HWR, of the 6,000 total WRA transits declared by its members worldwide in 2013, about 900, or 15%, passed through the Gulf of Guinea WRA.⁶¹ Thus, assuming that all breach premiums are similar, the total cost of insuring passages through the GoG WRA for HWR members was approximately \$2.65 million.

The second step is to determine the HWR's share of the total market for breach premiums in the Gulf of Guinea. For this section's purposes, vessels transiting the Gulf of Guinea and needing War Risk Insurance are defined as vessels 5,000 gross tons and above. BIMCO estimates that there were approximately 27,827 such vessels globally in 2014, giving the HWR members' 2,259 vessels a global market share of 8.1 percent. Based on this number and the estimated \$2.65 million collected from HWR members, the total amount of breach premiums in the Gulf of Guinea would be approximately \$32,687,000 million in 2013.

⁶¹ Hellenic War Risks, *Building on Success – Review of the Year*.

Cost of K&R Insurance

According to K&R market leader Hiscox, the company commands a 60–70% global market share by premium income.⁶² Based on their 2014 annual report, out of a total income in 2013 of \$3.28 billion, a total of 6%, equal to \$196.3 million, came from their specialty business, which includes kidnap and ransom, contingency, and personal accident insurance.⁶³ This equates to a global market of between \$280.4 million and \$327 million in this segment. Another estimate from August 2014 claims that global K&R premiums, including non-piracy threats, totaled “at least” \$250 million.⁶⁴ Because the Hiscox specialty business includes more than K&R products, it would appear realistic to assess the global K&R market as being between approximately \$250 million and \$292 million.

APPENDIX J – WEST AFRICAN LAWS RELATED TO PROSECUTING PIRACY

OBP has begun to research West African laws related to each regional country’s ability to prosecute acts of piracy, whether they occur in their territorial waters or on the high seas. Initially, OBP has reviewed the domestic legislation of 11 countries within the region. Our conclusions related to each country’s ability to prosecute acts of piracy and the limitations of jurisdiction are briefly assessed in the table below. OBP intends to review the remaining countries’ laws within the region. However, for purposes of this report, an analysis of the 11 countries’ laws demonstrates that only Liberia and Angola possess legislation that would allow them to prosecute acts of piracy regardless of where those acts occur. Conversely, the remaining nine countries do not currently have the ability to prosecute acts of piracy outside their territorial waters, save a few exceptions (usually if the piratical acts occur onboard a vessel with that country’s flag or are against that country’s nationals). The table below provides a cursory analysis of each country’s ability to prosecute acts of piracy.

					Angola
Ratified UNCLOS ⁶⁵	Ratified SUA ⁶⁶	Territorial Sea Claim	EEZ Claim		
Yes	Yes	12 nm ⁶⁷	200 nm ⁶⁸		
Piracy Legislation:	Allows jurisdiction to prosecute any person who, by violent means, takes over the command of a ship to commit theft or violent acts, or plunders a ship for personal gain, regardless of where the act occurs. ⁶⁹				
Criminal Law:	Criminalizes attempts, manslaughter, murder, assault, using firearms against another person, threatening others with violence, kidnapping, hostage-taking, hijacking ships, theft, robbery, and damaging others' property. ⁷⁰				
	Limits Angola's jurisdiction over criminal acts to those committed in Angola's territory or on an Angola-flagged vessel (with a few other exceptions if perpetrator is arrested in Angola's territory). ⁷¹				
Miscellaneous Laws:	None				
Ability to Prosecute:	Angola can prosecute:- Acts of piracy in territorial waters or on the high seas involving a vessel hijacking or robbery of a vessel. - Acts of piracy falling under the criminal law occurring within 12 nm or on Angola-flagged ships. Angola cannot prosecute:- Acts of piracy on the high seas where there was not an actual hijacking of a vessel or robbery (or attempted robbery), such as an attack simply for purposes of kidnapping the crew.				
Ratified UNCLOS	Ratified SUA	Territorial Sea Claim	EEZ Claim		Benin
Yes	Yes	200 nm ⁷²	None		
Piracy Legislation:	Limits prosecution of piracy to acts of "violence" committed by or against Benin-flagged ships. ⁷³ The law states that "convicted" pirates shall be prosecuted and punished under Benin's criminal law, potentially limiting any applicability of this law. ⁷⁴				
Criminal Law:	Criminalizes murder, assault, theft, kidnapping, and destruction of property. ⁷⁵ Does not criminalize robbery, conspiracies, or acts by accomplices or accessories. ⁷⁶

APPENDIX K – SEAFARER SURVEY

Participant Recruitment and Participation

Seafarers recruited for the study were identified through two pathways. Seafarers in the Philippines known by MPHRC to have been held hostage by pirates were directly approached to participate. In addition, a comparison sample of seafarers not known to have been attacked by pirates was approached by members of the research team in person at manning and training agencies in the Philippines.

175 seafarers agreed to participate in this study, including 37 seafarers known to have been attacked by pirates and 138 not known to have been attacked.

Coding for Post-traumatic Stress Disorder (PTSD) and Depression

PTSD was assessed using the Posttraumatic Checklist–Civilian scale,¹¹⁷ modified to ask specifically about piracy rather than a general traumatic experience. The PCL–C can be coded for the presence of probable PTSD by using an overall score for symptom severity, by coding for the presence of symptoms meeting the criteria for PTSD, or by both. We used the most restrictive approach of both: respondents were coded for probable PTSD if they had scores of 3 or greater on at least one item from the DSM-IV Axis B category for PTSD symptomatology, at least three items from Axis C, and at least two from Axis D; and also had an overall score for symptom severity of 35 or higher.

Probable depression was scored using the Center for Epidemiological Studies–Depression scale, a long-standing scale frequently used to assess depression.¹¹⁸ The CES-D has been used internationally and is accepted as a measure of depression for international samples, but there is a known issue that Southeast Asian populations tend to have higher mean scores on the CES-D than European populations.¹¹⁹ Data specific for what cutoff scores were appropriate for Filipino populations was not available, but recommended cutoff points for other Asian populations include using a score of 24 to diagnose probable depression in Korean populations¹²⁰ and a score of 19 in Japanese populations,¹²¹ compared to a typical cutoff score of 16 in American populations. In order to maximize the specificity of this assessment, a cutoff score of 24 was used to code for probable depression.

APPENDIX L – MASTER LIST OF EVENTS

Key:

Successful Incident
Unsuccessful Incident

The incidents in the tables below were drawn from a variety of sources. Many of them were open-source news articles, for which the reporter name is listed. Upon request, OBP can provide these exact citations. The majority of sources, however, were from several reporting bodies. These specific citations are provided below. To access these databases, many require either login information or a subscription. Here are the full names and citations for those sources which are not from news articles:

- **IMB:** ICC International Maritime Bureau, Live Piracy & Armed Robbery Report 2014¹²²
- **IMO:** International Maritime Organization, Piracy and Armed Robbery Database¹²³
- **MARLO:** U.S. Maritime Liaison Office (MARLO) Weekly, Piracy Analysis and Threat to Shipping (PATS)¹²⁴
- **NGA:** National Geospatial-Intelligence Agency, Anti-Shipping Activity Messages¹²⁵
- **ONI:** Office of Naval Intelligence, Worldwide Threat to Shipping (WTS) Report¹²⁶
- **ReCAAP:** Regional Cooperation Agreement on Combating Piracy and Armed Robbery Against Ships in Asia Information Sharing Center¹²⁷
- **Suritec:** Independent Global Incident Analysis, Piracy Report¹²⁸

122 “Live Piracy & Armed Robbery Report 2014,” ICC International Maritime Bureau, <https://www.icc-ccs.org/piracy-reporting-centre/live-piracy-report> (accessed December 15, 2014). The 2014 incidents are no longer available. For a complete list of these, please contact the IMB or OBP.

123 “GISIS Public Area, Piracy and Armed Robbery Database,” International Maritime Organization, <https://gisis.imo.org/Public/PAR/Search.aspx> (accessed May 15, 2015). You must create an account as a public user; once on the page select “search incidents” and search by date.

124 These reports can often be found online by searching for the name of the report, as well as adding on the pertinent year. To receive these reports on a regular basis requires a subscription. To subscribe, visit the website for the office’s contact email. “Essential Contact Information,” Maritime Liaison Office Bahrain, <http://www.cusnc.navy.mil/marlo/guidance.html> (accessed May 15, 2015).

125 “Anti-Shipping Activity Messages,” National Geospatial-Intelligence Agency, http://msi.nga.mil/NGAPortal/MSI.portal?_nfpb=true&_pageLabel=msi_portal_page_65 (accessed November 10, 2014). To access, you must use the date filter in the query box, and narrow the date range to 2014.

126 One can access these reports through the National Geospatial-Intelligence Agency’s website. “Worldwide Threat to Shipping Reports,” National Geospatial-Intelligence Agency, http://msi.nga.mil/NGAPortal/MSI.portal?_nfpb=true&_pageLabel=msi_portal_page_64 (accessed May 15, 2015).

127 OBP acquired information from ReCAAP’s various incidents reports, which can be accessed through ReCAAP’s website. “Incident Reports,” ReCAAP, <http://www.recaap.org/AlertsReports/IncidentReports.aspx?EntryId=11> (accessed May 15, 2015).
